many current texts in the area are just cookbooks and as a result students do not know why they perform the methods they are taught or why the methods work the strength of this book is that it readdresses these shortcomings by using examples often from real life and using real data the authors show how the fundamentals of probabilistic and statistical theories arise intuitively a modern introduction to probability and statistics has numerous quick exercises to give direct feedback to students in addition there are over 350 exercises half of which have answers of which half have full solutions a website gives access to the data files used in the text and for instructors the remaining solutions the only pre requisite is a first course in calculus the text covers standard statistics and probability material and develops beyond traditional parametric models to the poisson process and on to modern methods such as the bootstrap

this book is based mainly on the lecture notes that i have been using since 1993 for a course on applied probability for engineers that i teach at the ecole polytechnique de montreal this course is given to electrical computer and physics engineering students and is normally taken during the second or third year of their curriculum therefore we assume that the reader has acquired a basic knowledge of differential and integral calculus the main objective of this textbook is to provide a reference that covers the topics that every student in pure or applied sciences such as physics computer science engineering etc should learn in probability theory in addition to the basic notions of stochastic processes and statistics it is not easy to find a single work on all these topics that is both succinct and also accessible to non mathematicians because the students who for the most part have never taken a course on prob ability theory must do a lot of exercises in order to master the material presented i included a very large number of problems in the book some of which are solved in detail most of the exercises proposed after each chapter are problems written es pecially for examinations over the years they are not in general routine problems like the ones found in numerous textbooks

beginning with the historical background of probability theory this thoroughly revised text examines all important aspects of mathematical probability including random variables probability distributions characteristic and generating functions stochatic convergence and limit theorems and provides an introduction to various types of statistical problems covering the broad range of statistical inference requiring a prerequisite in calculus for complete understanding of the topics discussed the second edition contains new material on univariate distributions multivariate distributions large sample methods decision theory and applications of anova a primary text for a year long undergraduate course in statistics but easily adapted for a one semester course in probability only introduction to probability and statistics is for undergraduate students in a wide range of disciplines statistics probability mathematics social

some years ago when i assembled a number of general articles and lectures on probability and statistics their publication essays in probability and statistics methuen london 1962 received a some what better reception than i had been led to expect of such a miscellany i am consequently tempted to risk publishing this second collection the title i have given it taken from the first lecture seeming to me to indicate a coherence in my articles which my publishers might otherwise be inclined to query as in the first collection the articles are reprinted chronologically usually without comment one exception is the third not previously published and differing from the original spoken version both slightly where indicated in the text and by the addition of an appendix i apologize for the inevitable limitations due to date and also for any occasional repetition of the discussion e g on bayesian methods in statistical inference in particular readers technically interested in the classification and use of nearest neighbour models a topic raised in appendix ii of the fourth article should also refer to my monograph the statistical analysis of spatial pattern chapman and hall london 1976 where a much more up to date account of these models will be found and incidentally a further emphasis if one is needed of the common statistical theory of physics and biology march 1975 m s b
